

A B S T R A C T

A fluid dispenser for dispensing fluid in liquid or powder form, the fluid dispenser comprising a fluid
5 reservoir (30) of variable volume, said reservoir defining at least one movable wall (31, 32) that can be moved to vary the volume of the reservoir, the dispenser further comprising a dispensing orifice (311) in communication with the reservoir so that fluid from the
10 reservoir can be delivered through the dispensing orifice when the volume of the reservoir is reduced;

said fluid dispenser being characterized in that it further comprises actuating means (1, 2) making it possible, in a first stage, to increase the volume of the
15 reservoir by drawing air into the reservoir, and then, in a second stage, to reduce the volume of the reservoir by delivering air and fluid through the dispensing orifice.
